

EcoMatting™

COIR MATTING INSTALLATION

EcoMatting™ is a biodegradable erosion control fabric made up of a single layer of continuously woven, open mesh coir (coconut fiber) matting. It is designed to be used on slopes, shorelines and streamlines for erosion & sediment control. It is also designed to hold seed intact during the establishment of vegetative cover. When it biodegrades also adds nutrients to the soil which help seed establish more rapidly. Coir geotextiles are an environmentally friendly product.

To install simply prepare the slope, apply the appropriate seed and then apply EcoMatting™. EcoMatting™ should be installed as the above diagram recommends. Sod staples or biodegradable stakes should be used to secure the matting to the slope. Matting should be left in place to biodegrade and allow the vegetation to establish. See Specification Sheets for technical information on our coir matting.
